Declaration of Conformity: Invertek Drives Limited Offas Dyke Business Park Welshpool Powys UK SY21 8JF

Invertek Drives Ltd hereby states that the Optidrive ODV-2 product range conforms to the relevant safety provisions of the Low Voltage Directive 2006/95/EC and the EMC Directive 2004/108/EC and has been designed and manufactured in accordance with the following harmonised European standards:

EN 61800-5-1: 2003	Adjustable speed electrical power drive systems. Safety requirements. Electrical, thermal and energy.
EN 61800-3 2 <sup>nd</sup> Ed: 2004	Adjustable speed electrical power drive systems. EMC requirements and specific test methods
EN 55011: 2007	Limits and Methods of measurement of radio disturbance characteristics of industrial, scientific and
	medical (ISM) radio-frequency equipment (EMC)
EN60529: 1992	Specifications for degrees of protection provided by enclosures

#### **Electromagnetic Compatibility**

All Optidrives are designed with high standards of EMC in mind. All versions suitable for operation on Single Phase 230 volt and Three Phase 400 volt supplies and intended for use within the European Union are fitted with an internal EMC filter. This EMC filter is designed to reduce the conducted emissions back into the supply via the power cables for compliance with harmonised European standards.

It is the responsibility of the installer to ensure that the equipment or system into which the product is incorporated complies with the EMC legislation of the country of use. Within the European Union, equipment into which this product is incorporated must comply with the EMC Directive 2004/108/EC. When using an Optidrive with an internal or optional external filter, compliance with the following EMC Categories, as defined by EN61800-3:2004 can be achieved:

Drive Type / Rating		EMC Category							
_	C1	C2	С3						
1 Phase, 230 Volt Input	No additional filtering required	·	·						
ODV-2-x2xxx-1xFxx-xx	Use shielded motor cable								
3 Phase, 400 Volt Input	Use Additional External Filter	No additional filtering required							
IP20 & IP66 Models	Use shielded motor cable								
ODV-2-x4xxx-3xFxx-xx									
3 Phase, 400 Volt Input	Use Additional External Filter No Additional Filtering								
IP55 Models	Use shielded motor cable								
ODV-2-x4xxx-3xFxN-xx									
3 Phase, 525 & 600 Volt Input	This equipment is intended for fixed installation, and is not intended to conform to the EMC Directive								
All Models	without additional preventative measures being applied. Consult your Invertek Sales Partner for further								
ODV-2-x5xxx-3x0xx-xx	information.								
ODV-2-x5xxx-3x0xx-xx									
Compliance with EMC	Standards is dependent on a numb	er of factors including the environm	nent in which the drive is installed,						
	ency, motor, cable lengths and installation methods adopted.								
Note For motor cable lengt	ns greater than 100m, an output dv / dt filter must be used, please refer to the Invertek Stock Drives								
Catalogue for further	details

All Invertek Optidrive HVAC units carry a 2 year warranty against manufacturing defects from the date of manufacture. The manufacturer accepts no liability for any damage caused during or resulting from transport, receipt of delivery, installation or commissioning. The manufacturer also accepts no liability for damage or consequences resulting from inappropriate, negligent or incorrect installation, incorrect adjustment of the operating parameters of the drive, incorrect matching of the drive to the motor, incorrect installation, unacceptable dust, moisture, corrosive substances, excessive vibration or ambient temperatures outside of the design specification.

The local distributor may offer different terms and conditions at their discretion, and in all cases concerning warranty, the local distributor should be contacted first.

This user guide is the "original instructions" document. All non-English versions are translations of the "original instructions".

Contents of this User Guide are believed to be correct at the time of printing. In the interest of a commitment to a policy of continuous improvement, the manufacturer reserves the right to change the specification of the product or its performance or the contents of the User Guide without notice.

This User Guide is for use with version 1.30 Firmware.

#### User Guide 2.00

Invertek Drives Ltd adopts a policy of continuous improvement and whilst every effort has been made to provide accurate and up to date information, the information contained in this User Guide should be used for guidance purposes only and does not form the part of any contract.

# 1. Introduction

# 1.1. Important safety information

Please read the IMPORTANT SAFETY INFORMATION below, and all Warning and Caution information elsewhere.

Danger: Indicates a risk of electric shock, which, if not avoided, could result in damage to the equipment and possible injury or death.

Danger: Indicates a potentially hazardous situation other than electrical, which if not avoided, could result in damage to property.

This variable speed drive product (Optidrive) is intended for professional incorporation into complete equipment or systems as part of a fixed installation. If installed incorrectly it may present a safety hazard. The Optidrive uses high voltages and currents, carries a high level of stored electrical energy, and is used to control mechanical plant that may cause injury. Close attention is required to system design and electrical installation to avoid hazards in either normal operation or in the event of equipment malfunction. Only qualified electricians are allowed to install and maintain this product.

System design, installation, commissioning and maintenance must be carried out only by personnel who have the necessary training and experience. They must carefully read this safety information and the instructions in this Guide and follow all information regarding transport, storage, installation and use of the Optidrive, including the specified environmental limitations.

Do not perform any flash test or voltage withstand test on the Optidrive. Any electrical measurements required should be carried out with the Optidrive disconnected.

multimeter that no voltage is present on any drive power terminals prior to commencing any work.

carried out with the Optidrive disconnected.

Electric shock hazard! Disconnect and ISOLATE the Optidrive before attempting any work on it. High voltages are present at the terminals and within the drive for up to 10 minutes after disconnection of the electrical supply. Always ensure by using a suitable

Where supply to the drive is through a plug and socket connector, do not disconnect until 10 minutes have elapsed after turning off the supply.

Ensure correct earthing connections and cable selection as per defined by local legislation or codes. The drive may have a leakage current of greater than 3.5mA; furthermore the earth cable must be sufficient to carry the maximum supply fault current which normally will be limited by the fuses or MCB. Suitably rated fuses or MCB should be fitted in the mains supply to the drive, according to any local legislation or codes.

Do not carry out any work on the drive control cables whilst power is applied to the drive or to the external control circuits. Within the European Union, all machinery in which this product is used must comply with the Machinery Directive 2006/42/EC, Safety of Machinery. In particular, the machine manufacturer is responsible for providing a main switch and ensuring the electrical equipment complies with EN60204-1.

The level of integrity offered by the Optidrive control input functions – for example stop/start, forward/reverse and maximum speed, is not sufficient for use in safety-critical applications without independent channels of protection. All applications where malfunction could cause injury or loss of life must be subject to a risk assessment and further protection provided where needed.

The driven motor can start at power up if the enable input signal is present.

The STOP function does not remove potentially lethal high voltages. ISOLATE the drive and wait 10 minutes before starting any work on it. Never carry out any work on the Drive, Motor or Motor cable whilst the input power is still applied.

The Optidrive can be programmed to operate the driven motor at speeds above or below the speed achieved when connecting the motor directly to the mains supply. Obtain confirmation from the manufacturers of the motor and the driven machine about suitability for operation over the intended speed range prior to machine start up.

Do not activate the automatic fault reset function on any systems whereby this may cause a potentially dangerous situation.

IP55 and IP66 drives provide their own pollution degree 2 environments. IP20 drives must be installed in a pollution degree 2 environment, mounted in a cabinet with IP54 or better.

Optidrives are intended for indoor use only

When mounting the drive, ensure that sufficient cooling is provided. Do not carry out drilling operations with the drive in place, dust and swarf from drilling may lead to damage.

The entry of conductive or flammable foreign bodies should be prevented. Flammable material should not be placed close to the drive

Relative humidity must be less than 95% (non-condensing).

Ensure that the supply voltage, frequency and no. of phases (1 or 3 phase) correspond to the rating of the Optidrive as delivered.

Never connect the mains power supply to the Output terminals U, V, W.

Do not install any type of automatic switchgear between the drive and the motor

Wherever control cabling is close to power cabling, maintain a minimum separation of 100 mm and arrange crossings at 90 degrees

Ensure that all terminals are tightened to the appropriate torque setting

Do not attempt to carry out any repair of the Optidrive. In the case of suspected fault or malfunction, contact your local Invertek Drives Sales Partner for further assistance.

<sup>\*</sup> Note: The final two characters of the model number relate to available factory build options as follows

- -TN OLED Text Display, standard PCB coating
- -TC OLED Text Display, additional PCB conformal coating

# 2.2. Identifying the Drive by Model Number

Each drive can be identified by its model number, shown below. The model number is on the shipping label and the drive nameplate. The model number includes the drive and factory fitted options.

#### Note

- Optidrive HVAC drives are not available with brake chopper / transistor
- All IP20 Optidrive HVAC drives are available with 7 Segment LED Display only
- All IP55 & IP66 Optidrive HVAC drives are available with OLED Text Display only
- All 230 & 400 Volt drives have an internal EMC filter fitted as standard
- All 525 & 600 Volt drives have no internal EMC filter

# 3. Mechanical Installation

# 3.1. General

- The Optidrive should be mounted in a vertical position only, on a flat, flame resistant, vibration free mounting using the integral
  mounting holes or DIN Rail clip (Frame Size 2 only).
- The Optidrive must be installed in a pollution degree 1 or 2 environment only.
- Do not mount flammable material close to the Optidrive
- Ensure that the minimum cooling air gaps, as detailed in sections 3.6, 3.7 and 3.8 are left clear
- Ensure that the ambient temperature range does not exceed the permissible limits for the Optidrive given in section 11.1
- Provide suitable clean, moisture and contaminant free cooling air sufficient to fulfil the cooling requirements of the Optidrive

#### 3.2. Before Installation

- · Carefully Unpack the Optidrive and check for any signs of damage. Notify the shipper immediately if any exist.
- Check the drive rating label to ensure it is of the correct type and power requirements for the application.
- To prevent accidental damage always store the Optidrive in its original box until required. Storage should be clean and dry and within the temperature range –40°C to +60°C

#### 3.3. UL Compliant Installation

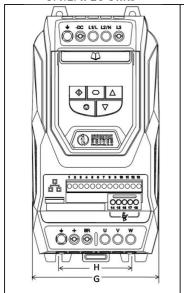

Note the following for UL-compliant installation:

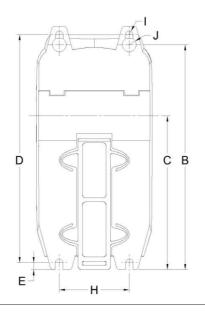

- For an up to date list of UL compliant products, please refer to UL listing NMMS.E226333
- The drive can be operated within an ambient temperature range as stated in section 11.1
- For IP20 & IP40 units, installation is required in a pollution degree 1 environment
- For IP55 & IP66 units, installation in a pollution degree 2 environment is permissible
- UL Listed ring terminals / lugs must be used for all bus bar and grounding connections

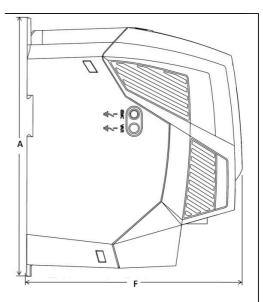

Refer to section 11.4 on page 49 for Additional Information for UL Approved Installations

# 3.4. Mechanical dimensions and Weights

#### 3.5. Guidelines for Enclosure mounting (IP20 Units)

- IP20 drives are suitable for use in pollution degree 1 environments, according to IEC-664-1. For pollution degree 2 or higher environments, drives should be mounted in a suitable control cabinet with sufficient ingress protection to maintain a pollution degree 1 environment around the drive.
- Enclosures should be made from a thermally conductive material.
- Ensure the minimum air gap clearances around the drive as shown below are observed when mounting the drive.
- Where ventilated enclosures are used, there should be venting above the drive and below the drive to ensure good air circulation. Air should be drawn in below the drive and expelled above the drive.
- In any environments where the conditions require it, the enclosure must be designed to protect the Optidrive against ingress of airborne dust, corrosive gases or liquids, conductive contaminants (such as condensation, carbon dust, and metallic particles) and sprays or splashing water from all directions.
- High moisture, salt or chemical content environments should use a suitably sealed (non-vented) enclosure.

The enclosure design and layout should ensure that the adequate ventilation paths and clearances are left to allow air to circulate through the drive heatsink. Invertek Drives recommend the following minimum sizes for drives mounted in non-ventilated metallic enclosures:-

	Drive Size		x ve & low		Y her de	Betv	Z ween	Recommended airflow	
ĺ		mm	in	mm	in	mm in		CFM (ft³/min)	
	2	75	2.95	50	1.97	46 1.81		11	
ĺ	3	100	3.94	50	1.97	52	2.05	26	

#### Note:

Dimension Z assumes that the drives are mounted side-byside with no clearance.

Typical drive heat losses are 3% of operating load conditions.

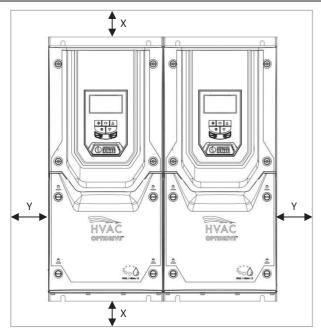

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

# 3.6. Mounting the Drive - IP20 Units

- IP20 Units are intended for installation within a control cabinet.
- When mounting with screws
  - Using the drive as a template, or the dimensions shown above, mark the locations for drilling
  - o Ensure that when mounting locations are drilled, the dust from drilling does not enter the drive
  - Mount the drive to the cabinet backplate using suitable M5 mounting screws
  - Position the drive, and tighten the mounting screws securely
- When Din Rail Mounting (Frame Size 2 Only)
  - o Locate the DIN rail mounting slot on the rear of the drive onto the top of the DIN rail first
  - o Press the bottom of the drive onto the DIN rail until the lower clip attaches to the DIN rail
  - o If necessary, use a suitable flat blade screw driver to pull the DIN rail clip down to allow the drive to mount securely on the rail
  - To remove the drive from the DIN rail, use a suitable flat blade screwdriver to pull the release tab downwards, and lift the bottom of the drive away from the rail first

#### 3.7. Guidelines for mounting IP55 Units

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 11.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives
- IP55 units do not require mounting inside an electrical control cabinet; however they may be if desired.

Drive	)	Χ	Y	
Size	Abo	ve &	Eith	er
	Bel	low	Sid	e
	mm	in	mm	in
2 (IP66)	150	5.9	10	0.394
3 (IP66)	150	5.9	10	0.394
4 (IP55)	200	7.9	10	0.394
5 (IP55)	200	7.9	10	0.394
6 (IP55)	200	7.9	10	0.394
7 (IP55)	200	7.9	10	0.394
,				

#### Note:

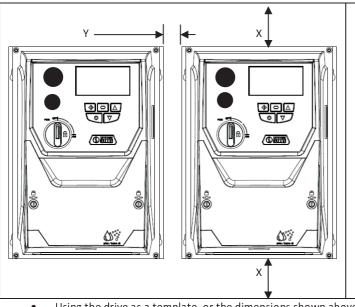

Typical drive heat losses are 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the IP protection of the drive are required. Gland sizes should be selected based on the number and size of the required connection cables. Drives are supplied with a plain, undrilled gland plate to allow the correct hole sizes to be cut as required. Remove the gland plate from the drive prior to drilling.

#### 3.8. Guidelines for mounting (IP66 Units)

- Before mounting the drive, ensure that the chosen location meets the environmental condition requirements for the drive shown in section 11.1
- The drive must be mounted vertically, on a suitable flat surface
- The minimum mounting clearances as shown in the table below must be observed
- The mounting site and chosen mountings should be sufficient to support the weight of the drives

Drive	>	(	`	Y
Size	Abov	/e &	Eit	her
	Bel	ow	Si	de
	mm	in	mm	in
2	200	7.87	10	0.39
3	200	7.87	10	0.39

#### Note:

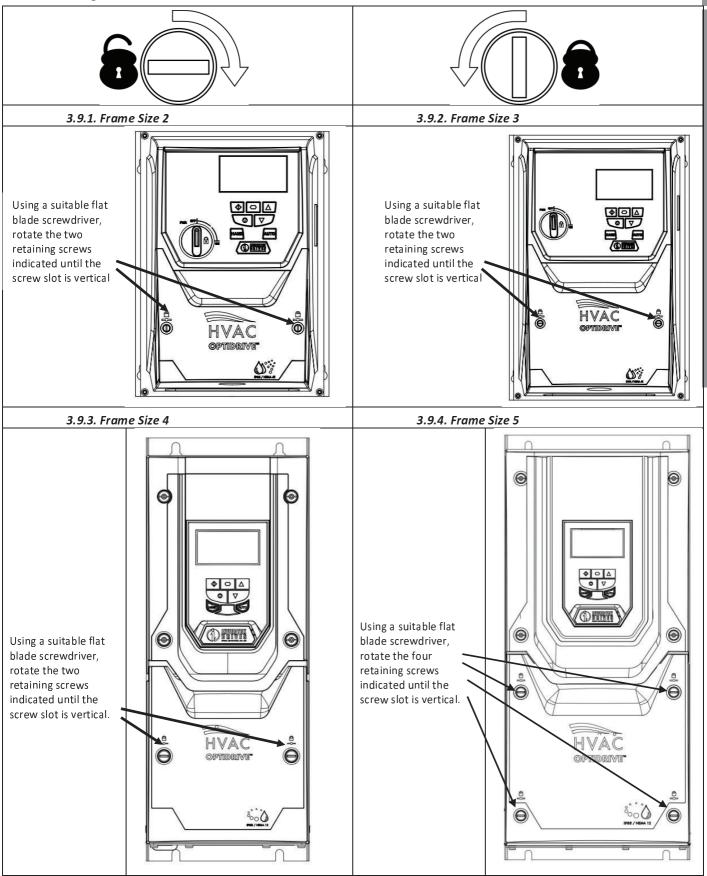

Typical drive heat losses are approximately 3% of operating load conditions.

Above are guidelines only and the operating ambient temperature of the drive MUST be maintained at all times.

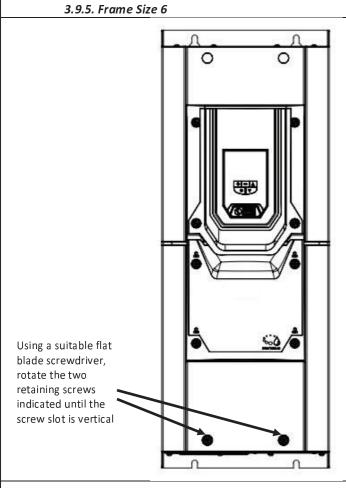

Cable Gland Sizes	
Frame Power Cable Motor Ca	able Control Cables
2 M25 (PG2* M25 (PG	2* M20 (PG13.5)
3 M25 (PG2* M25 (PG	2* M20 (PG13.5)

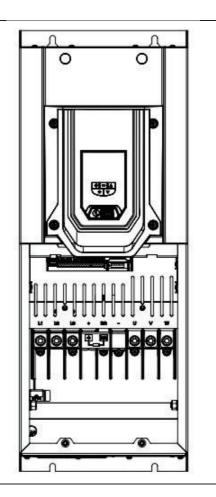

- Using the drive as a template, or the dimensions shown above, mark the locations required for drilling
- Suitable cable glands to maintain the ingress protection of the drive are required. Gland holes for power and motor cables are premoulded into the drive enclosure, recommended gland sizes are shown above. Gland holes for control cables may be cut as required.

# 3.9. Removing the Terminal Cover

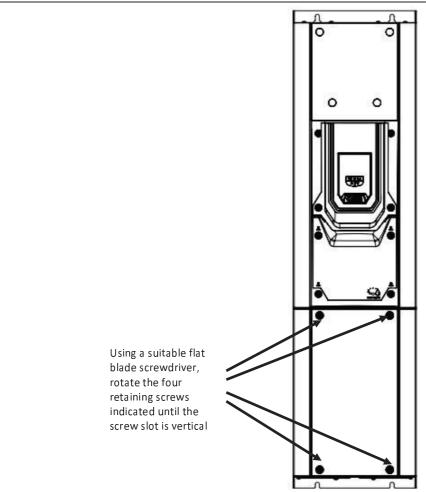

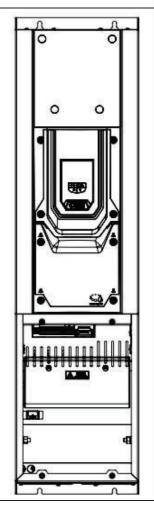

**Terminal Cover Release Screws** 

#### 3.9.6. Frame Size 7

#### 3.10. Routine Maintenance

The drive should be included within the scheduled maintenance program so that the installation maintains a suitable operating environment, this should include:

- Ambient temperature is at or below that set out in the "Environment" section.
- Heat sink fans freely rotating and dust free.
- The Enclosure in which the drive is installed should be free from dust and condensation; furthermore ventilation fans and air filters should be checked for correct air flow.

Checks should also be made on all electrical connections, ensuring screw terminals are correctly torqued; and that power cables have no signs of heat damage.

#### 3.11. Gland Plate and Lock Off

The use of a suitable gland system is required to maintain the appropriate IP / Nema rating. Cable entry holes will need to be drilled to suit this system. Some guidelines sizes are defined below:

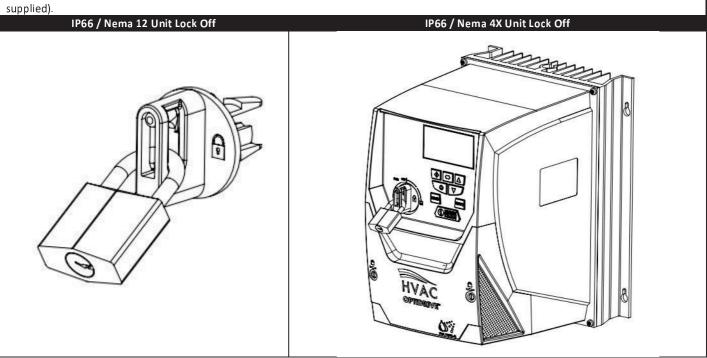

Please take care when drilling to avoid leaving any particles within the product.

Cable Gland recommer	nded Hole Sizes & types:			
	Min Gland Rating	Hole Size	Imperial	Metric
Size 2	IP66	3 x 22mm	3 PG13.5	3 x M20
Size 3	IP66	1 x 22mm and 2 x 28mm	1 PG13.5 and 2 PG16	1 x M20 and 2 x M25

- UL rated ingress protection ("Type") is only met when cables are installed using a UL recognized bushing or fitting for a flexible-conduit system which meets the required level of protection ("Type")
- For conduit installations the conduit entry holes require standard opening to the required sizes specified per the NEC
- Not intended for rigid conduit system

#### Power Isolator Lock Off - IP66 with Built in Isolator Option

On the switched models the main power isolator switch can be locked in the 'Off' position using a 20mm standard shackle padlock (not supplied).

# 4. Electrical Installation

# 4.1. Grounding the Drive

This manual is intended as a guide for proper installation. Invertek Drives Ltd cannot assume responsibility for the compliance or the non-compliance to any code, national, local or otherwise, for the proper installation of this drive or associated equipment. A hazard of personal injury and/or equipment damage exists if codes are ignored during installation.

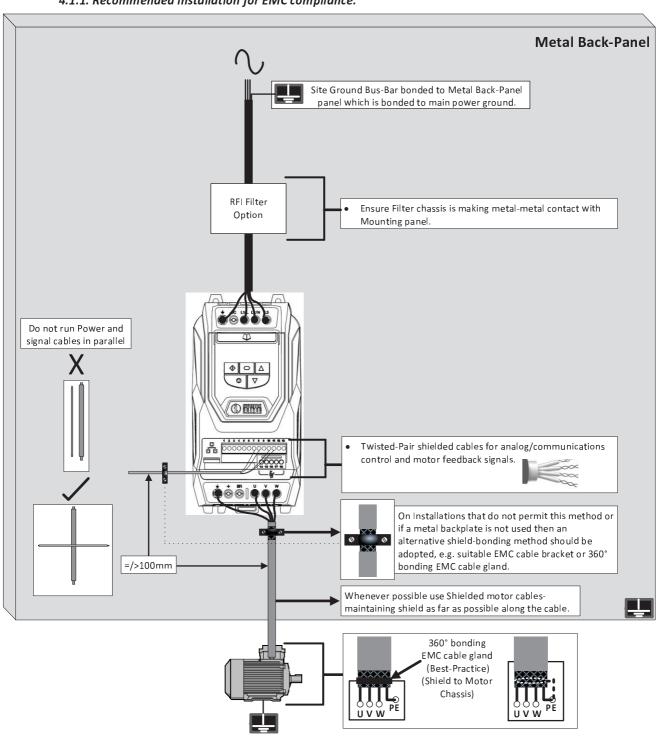

This Optidrive contains high voltage capacitors that take time to discharge after removal of the main supply. Before working on the drive, ensure isolation of the main supply from line inputs. Wait ten (10) minutes for the capacitors to discharge to safe voltage levels. Failure to observe this precaution could result in severe bodily injury or loss of life.

Only qualified electrical personnel familiar with the construction and operation of this equipment and the hazards involved should install, adjust, operate, or service this equipment. Read and understand this manual and other applicable manuals in their entirety before proceeding. Failure to observe this precaution could result in severe bodily injury or loss of life.

#### 4.1.1. Recommended installation for EMC compliance.

#### 4.1.2. Grounding Guidelines

The ground terminal of each Optidrive should be individually connected DIRECTLY to the site ground bus bar (through the filter if installed). Optidrive ground connections should not loop from one drive to another, or to, or from any other equipment. Ground loop impedance must confirm to local industrial safety regulations. To meet UL regulations, UL approved ring crimp terminals should be used for all ground wiring connections

The drive Safety Ground must be connected to system ground. Ground impedance must conform to the requirements of national and local industrial safety regulations and/or electrical codes. The integrity of all ground connections should be checked periodically.

#### 4.1.3. Protective Earth Conductor

The Cross sectional area of the PE Conductor must be at least equal to that of the incoming supply conductor.

# 4.1.4. Safety Ground 🖶

This is the safety ground for the drive that is required by code. One of these points must be connected to adjacent building steel (girder, joist), a floor ground rod, or bus bar. Grounding points must comply with national and local industrial safety regulations and/or electrical codes.

#### 4.1.5. Motor Ground

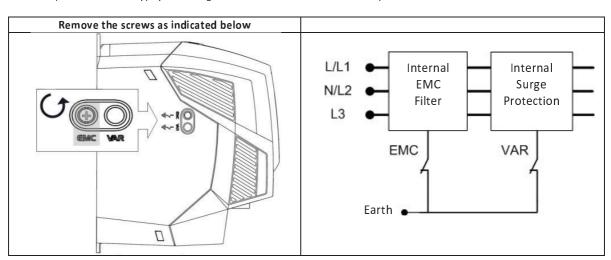

The motor ground must be connected to one of the ground terminals on the drive.

#### 4.1.6. Ground Fault Monitoring

As with all inverters, a leakage current to earth can exist. The Optidrive is designed to produce the minimum possible leakage current whilst complying with worldwide standards. The level of current is affected by motor cable length and type, the effective switching frequency, the earth connections used and the type of RFI filter installed. If an ELCB (Earth Leakage Circuit Breaker) is to be used, the following conditions apply: -

- A Type B Device must be used
- The device must be suitable for protecting equipment with a DC component in the leakage current
- Individual ELCBs should be used for each Optidrive

Drives with an EMC filter have an inherently higher leakage current to Ground (Earth). For applications where tripping occurs the EMC filter can be disconnected (on IP20 units only) by removing the EMC screw on the side of the product.

The Optidrive product range has input supply voltage surge suppression components fitted to protect the drive from line voltage transients, typically originating from lightning strikes or switching of high power equipment on the same supply.

#### 4.1.7. Shield Termination (Cable Screen)

The safety ground terminal provides a grounding point for the motor cable shield. The motor cable shield connected to this terminal (drive end) should also be connected to the motor frame (motor end). Use a shield terminating or EMI clamp to connect the shield to the safety ground terminal.

# 4.2. Wiring Precautions

Connect the Optidrive according to section 4.3 and 4.4, ensuring that motor terminal box connections are correct. There are two connections in general: Star and Delta. It is essential to ensure that the motor is connected in accordance with the voltage at which it will be operated. For more information, refer to section 4.5 Motor Terminal Box Connection.

It is recommended that the power cabling should be 4-core PVC-insulated screened cable, laid in accordance with local industrial regulations and codes of practice.

#### 4.3. Incoming Power Connection

- For a single phase supply, power should be connected to L1/L, L2/N.
- For 3 phase supplies power should be connected to L1, L2, and L3. Phase sequence is not important.
- For compliance with CE and C Tick EMC requirements, a symmetrical shielded cable is recommended.
- A fixed installation is required according to IEC61800-5-1 with a suitable disconnecting device installed between the Optidrive and the AC Power Source. The disconnecting device must conform to the local safety code / regulations (e.g. within Europe, EN60204-1, Safety of machinery).
- The cables should be dimensions according to any local codes or regulations. Guideline dimensions are given in section 13.4.
- Suitable fuses to provide wiring protection of the input power cable should be installed in the incoming supply line, according to the
  data in section 13.4. The fuses must comply with any local codes or regulations in place. In general, type gG (IEC 60269) or UL type
  T fuses are suitable; however in some cases type aR fuses may be required. The operating time of the fuses must be below 0.5
  seconds.
- Where allowed by local regulations, suitably dimensioned type B MCB circuit breakers of equivalent rating may be utilised in place of fuses, providing that the clearing capacity is sufficient for the installation.
- When the power supply is removed from the drive, a minimum of 30 seconds should be allowed before re-applying the power. A minimum of 10 minutes should be allowed before removing the terminal covers or connection.
- The maximum permissible short circuit current at the Optidrive Power terminals as defined in IEC60439-1 is 100kA.
- An optional Input Choke is recommended to be installed in the supply line for drives where any of the following conditions occur:-
  - The incoming supply impedance is low or the fault level / short circuit current is high
  - O The supply is prone to dips or brown outs
  - An imbalance exists on the supply (3 phase drives)
  - The power supply to the drive is via a bus-bar and brush gear system (typically overhead Cranes).
- In all other installations, an input choke is recommended to ensure protection of the drive against power supply faults. Refer to your local Invertek sales partner for available options
- Optidrive HVAC models in frame sizes 4 to 8 are factory fitted with an Input choke as standard.

#### 4.4. Drive and Motor Connection

- The drive inherently produces fast switching of the output voltage (PWM) to the motor compared to the mains supply, for motors which have been wound for operation with a variable speed drive then there is no preventative measures required, however if the quality of insulation is unknown then the motor manufacturer should be consulted and preventative measures may be required.
- The motor should be connected to the Optidrive U, V, and W terminals using a suitable 3 or 4 core cable. Where a 3 core cable is utilised, with the shield operating as an earth conductor, the shield must have a cross sectional area at least equal to the phase conductors when they are made from the same material. Where a 4 core cable is utilised, the earth conductor must be of at least equal cross sectional area and manufactured from the same material as the phase conductors.
- The motor earth must be connected to one of the Optidrive earth terminals.
- For compliance with the European EMC directive, a suitable screened (shielded) cable should be used. Braided or twisted type screened cable where the screen covers at least 85% of the cable surface area, designed with low impedance to HF signals are recommended as a minimum. Installation within a suitable steel or copper tube is generally also acceptable.
- The cable screen should be terminated at the motor end using an EMC type gland allowing connection to the motor body through the largest possible surface area
- Where drives are mounted in a steel control panel enclosure, the cable screen may be terminated directly to the control panel using a suitable EMC clamp or gland, as close to the drive as possible.
- For IP55 drives, connect the motor cable screen to the internal ground clamp

#### 4.5. Motor Terminal Box Connections

Most general purpose motors are wound for operation on dual voltage supplies. This is indicated on the nameplate of the motor

This operational voltage is normally selected when installing the motor by selecting either STAR or DELTA connection. STAR always gives the higher of the two voltage ratings.

Incoming Supply Voltage	Motor Nameplate Voltages		Connection
230	230 / 400		DELTA A
400	400 / 690	Delta	
600	600 / 1050		u v w
400	230 / 400		STAR A
600	340 / 600	Star	

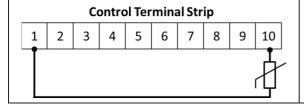

# 4.6. Motor Thermal overload Protection.

#### 4.6.1. Internal Thermal overload protection.

The drive has an in-built motor thermal overload function; this is in the form of an "I.t-trP" trip after delivering >100% of the value set in P1-08 for a sustained period of time (e.g. 110% for 60 seconds).

#### 4.6.2. Motor Thermistor Connection

Where a motor thermistor is to be used, it should be connected as follows:-

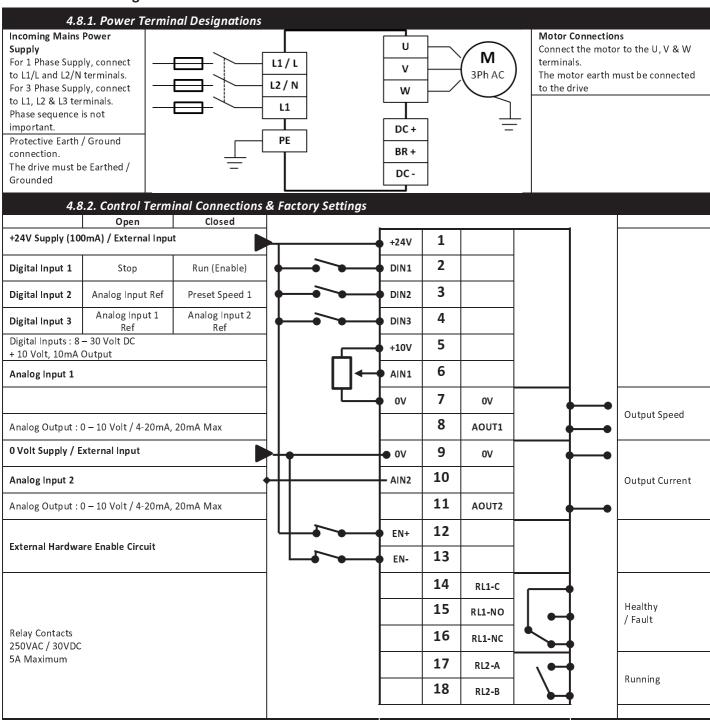

#### Additional Information

- Compatible Thermistor : PTC Type,  $2.5k\Omega$  trip level
- Use a setting of P1-13 that have Input 5 function as External Trip, e.g.
   P1-13 = 6. Refer to section 8.1 for further details.

# 4.7. Control Terminal Wiring

- All analog signal cables should be suitably shielded. Twisted pair cables are recommended.
- Power and Control Signal cables should be routed separately where possible, and must not be routed parallel to each other
- Signal levels of different voltages e.g. 24 Volt DC and 110 Volt AC, should not be routed in the same cable.
- Maximum control terminal tightening torque is 0.5Nm
- Control Cable entry conductor size: 0.05 2.5 mm<sup>2</sup> / 30 12 AWG.

#### 4.8. Connection Diagram

# 5. Managing the Keypad

The drive is configured and its operation monitored via the built in keypad and display. IP20 Drives:

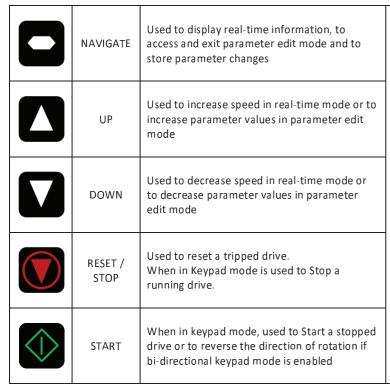

IP20 rated drives are supplied with a 7 Segment LED display and a five button keypad (Start, Stop, Navigate, Up, Down)

IP55 and IP66 Drives:

IP55 and IP66 rated drives are supplied with an OLED multi-line text display and a seven button keypad (Start, Stop, Navigate, Up, Down, Hand, Auto)

Commissioning and operation of the drive with the two different Keypads and displays is detailed below.

# 5.1. Keypad Layout and Function – Standard LED Keypad (IP20 Drives)

#### 5.2. Changing Parameters – Standard LED Keypad (IP20 Drives)

# 6. Commissioning

#### 6.1. General

The following guidelines apply to all applications

#### 6.1.1. Entering the motor nameplate information

Optidrive HVAC uses the information from the motor nameplate to

- Operate the motor with the best possible efficiency level
- Protect the motor against possible damage due to operation in overload condition

In order to achieve this, the Optidrive requires that the following information from the motor nameplate is entered into the parameters :-

**P1-07 Motor Rated Voltage**. This is the operating voltage for the motor in its present wiring configuration (Star or Delta). The maximum output voltage from the Optidrive can never exceed the incoming supply voltage.

P1-08 Motor Rated Current. This is the full load current of the motor from the nameplate

P1-09 Motor Rated Frequency. This is the standard operating frequency of the motor, generally 50 or 60Hz

**P1-10 Motor Rated Speed**. This parameter can optionally be set to the RPM shown on the motor nameplate. When this parameter is entered, all speed related parameters in the drive are displayed in RPM. When the parameter is set to zero, all speed related parameters are displayed in Hz.

#### 6.1.2. Minimum and Maximum Frequencies / Speeds

Optidrive HVAC units are factory set to operate the motor from zero up to base speed (50 or 60Hz output). In general, this operating range is suitable for a wide range of requirements, however in some cases it may be desired to adjust these limits, e.g. where the maximum speed of a fan or pump may provide excessive flow, or where operation below a certain speed is never required. In this case, the following parameters can be adjusted to suit the application:-

**P1-01 Maximum Frequency**. In general this should match the motor rated frequency. If operation above this frequency is desired, confirmation from the motor manufacturer, and the manufacturer of any connected fan or pump should be sought that this is permissible, and will not cause damage to the equipment.

**P1-02 Minimum Frequency.** A suitable minimum can be set to prevent the motor operating at low speed, which may cause the motor to overheat. In some applications, such as a pump circulating water through a boiler, it may be necessary to set a speed to ensure the boiler does not run dry during operation.

#### 6.1.3. Acceleration and Deceleration Ramp Times

Optidrive HVAC units are factory set with acceleration and deceleration ramp rates set to 30 seconds. The default value is suitable for the majority of HVAC applications but can be altered by changing the values in parameters P1-03 and P1-04. Care must be taken to ensure the driven load is capable of performing the specified ramps and that nuisance trips due to excessively short ramp times are not produced. The ramp times entered in the parameter set always specify the time taken to ramp between 0Hz and motor rated speed P1-09. For example; If ramp rate = 30 seconds and P1-09 (motor vase speed) = 50Hz, and assuming the motor is currently running at 25Hz and the drive is commanded to accelerate to 50Hz. The time taken to reach 50Hz would be 30 seconds(P1-03) / 50 (P1-09) \* 25 (required change in speed) = 15(s)

P1-03 Acceleration Ramp Rate: Time taken for the drive to accelerate the motor from OHz to Motor base speed, P1-09 in seconds.

P1-04 Deceleration Ramp Rate: Time taken for the drive to decelerate the motor from Motor base speed, P1-09 to 0Hz in seconds.

#### 6.1.4. Stop Mode Selection

Optidrive HVAC units can be programmed to either apply a fixed deceleration to the motor during stopping, or to release control of the motor and allow it to coast or free-wheel to a stop. The default selection is for the drive is ramp to stop and behaviour is programmed using parameter P1-05.

P1-05 Stop Mode Select: Defines how the motor will be stopped in the event of the enable input being removed from the drive. Ramp to stop (P1-05 = 0) will ramp the drive to stop using the value for deceleration entered in P1-04. Coast to stop (P1-05 = \* will allow the motor to coast to stop (uncontrolled).

#### 6.1.5. Energy Optimiser

The Energy Optimiser attempts to reduce the overall energy consumed by the drive and motor when operating at constant speeds and light loads. The Energy Optimiser is intended for applications where the drive may operate for some periods of time with constant speed and light motor load.

P1-06 Energy Optimiser: 0 = Disabled, 1 = Enabled.

#### 6.1.6. Voltage Boost

Voltage boost is used to increase the applied motor voltage at low output frequencies, in order to improve low speed and starting torque. Excessive voltage boost levels may result in increased motor current and temperature, and force ventilation of the motor may be required. The default value for Voltage boost is set between 0.5 and 2.5%, depending on drive size, and is typically ok for the majority of HVAC applications.

P1-11 Voltage Boost: Set as a percentage of motor rated voltage P1-07

#### 7. Parameters

#### 7.1. Parameter Set Overview

The Optidrive HVAC Parameter set consists of 9 groups as follows:

- Group 1 Basic Parameter Set
- Group 2 Extended Parameter Set
- Group 3 User PID Control Parameter Set
- Group 4 Motor Control Parameters
- Group 5 Field Bus Communications Parameter Set
- Group 8 HVAC Specific Functions Parameter Set
- Group 0 Monitoring and Diagnostic Parameters (Read Only)

When the Optidrive is reset to factory defaults, or is in its factory supplied state, only Group 1 Parameters can be accessed. In order to allow access to parameters from the higher level groups, P1-14 must be set to the same value as P2-40 (Default setting = 10\*. With this setting, parameter groups 1 – 5 and group 8 can be accessed, along with the first 39 parameters in Group 0. These parameters are listed in the tables below.

For advanced parameter access, P1-14 can be set to the same value as P6-30 (Default setting = 20\*, which allows access to all parameter groups and ranges. Advanced parameter descriptions are listed in the advanced user guide.

Values given in brackets () are default settings for horsepower rated drive models.

# 7.2. Parameter Group 1 – Basic Parameters

#### Notes

Inputs 1 – 3 are Digital inputs only

Inputs 4 & 5 may be used as Analog or Digital inputs, depending on the setting of P1-13

Note: "Motor thermistor trip" connection is via analog input 2 and is configured by parameter P2-33 (PEc-Eh). The "External trip" input is no longer utilised for the thermistor input (this is different to the ODP drive and E2 drive).

<sup>\*(\*:</sup> Logic shown is as per the default setting. Fire mode logic can be configured through parameter P8-09.

<sup>\*(2):</sup> Default setting for P1-13 = 1

<sup>\*(3):</sup> When the drive is in PID control (P1-12 = 3) and digital preset reference is selected (P3-05 = 0) then P1-13 can be set to 1, 9, or 10 to allow selection between two independent digital references using digital input 2. Digital preset reference 1 and 2 are set in P3-06 and P3-15 respectively.

## 9.2. Parameter Group 3 – PID Control

Par	Parameter Name	Minimum	Maximum	Default	Units			
P3-01	PID Proportional Gain	0.1	30.0	1.0	-			
	PID Controller Proportional Gain. Instantaneous error between the feedback and the set-point in the PID controller is multiplied							
	by P3-01 to produce the output from the PID controller. Higher values of prope							
	output frequency in response to changes in the PID set-point or feedback signs							
P3-02	PID Integral Time	0.0	30.0	1.0	Seconds			
	PID Controller Integral Time. Accumulated error in the PID control. Uses accum							
	signals to influence the output from the PID controller. P3-02 is the time const		-	. Larger value	s provide a			
	more damped response. Lower values result is a faster system response but m		,					
P3-03	PID Differential Time	0.00	1.00	0.0	Seconds			
	PID Differential Time Constant. The Differential time constant references the r	_		•				
	works to slow the rate of change of the PID controller, particularly as it approa							
	decrease overshoot but slow down response and may lead to instability. <b>Note</b>		-	lt which disa	bles the			
	differential time constant. Care must be taken when adjusting this value out	1						
P3-04	PID Operating Mode	0	1	0	-			
	<b>0 : Direct Operation</b> . Use this mode if an increase in the feedback signal should							
	1: Inverse Operation. Use this mode if an increase in the feedback signal shou	ıld result in ar	increase in t	he motor spe	ed			
P3-05	PID Reference Select	0	2	0	-			
	Selects the source for the PID Reference / Set-point							
	0 : Digital Preset Set-point. P3-06 is used							
	1 : Analog Input 1 Set-point							
	2 : Analog Input 2 Set-point	1		ı				
P3-06	PID Digital Reference Value	0.0	100.0	0.0	%			
	When P3-05 = 0, this parameter sets the preset digital reference (set-point) used for the PID Controller							
P3-07	PID Output Upper Limit	P3-08	100.0	100.0	%			
	Limits the maximum value output from the PID controller							
P3-08	PID Output Lower Limit	0.0	P3-07	0.0	%			
	Limits the minimum output from the PID controller							

Par	Parameter Name	Minimum	Maximum	Default	Units				
P3-09	PID Output Limit Select	0	3	0	-				
	0 : Digital Output Limits. The output range of the PID controller is limited by the		_						
	1: Analog Input 1 Provides a Variable Upper Limit. The output range of the PID controller is limited by the values of P3-08 & the								
	signal applied to Analog Input 1		,						
	2: Analog Input 1 Provides a Variable Lower Limit. The output range of the Pl	D controller i	s limited by th	ne signal appl	ied to				
	Analog Input 1 & the value of P3-07		ŕ						
	3: PID output Added to Analog Input 1 Value. The output value from the PID (	Controller is a	dded to the s	peed referen	ce applied				
	to the Analog Input 1								
P3-10	PID Feedback Source Select	0	1	0	-				
	Defines the source of the PID control feedback (location of the feedback senso	r)							
	<b>0</b> : Analog Input <b>2</b> : 0 – 100.0%								
	1 : Analog Input 1 : 0 - 100.0%								
	2: Motor current: 0 – 100.0% of P1-08 Value								
	3 : DC bus voltage : $0 - 1000 \text{ Volt} = 0 - 100.0\%$								
	4 : Analog input 1 – Analog input 2 : Differential of Analog 1 – Analog 2 = 0 – 100.0%								
	5: Larger value between AnIn1 and AnIn2: The greater of Analog input 1 or A	Analog Input 2	is always use	ed					
P3-11	PID Error to Enable Ramp	0.0	25.0	0.0	%				
	Defines a threshold PID error level, whereby if the difference between the set-	point and fee	edback value i	s less than th	e set				
	threshold, the internal ramp times of the drive are disabled to allow the drive	to react quick	ly to small eri	rors. Where a	greater				
	PID error exists, the ramp times are enabled to limit the rate of change of mot	or speed.							
	Setting to 0.0 means that the drive ramps are always enabled. This parameter								
	internal ramps where a fast reaction to the PID control is required, however by only disabling the ramps when a small PID error								
	exists, the risk of possible over current or over voltage trips being generated a	re reduced.							
P3-12	Feedback Display Scaling	0.000	50.000	0.000	-				
	Applies a scaling factor to the displayed PID feedback, allowing the user to disp	olay the actua	ıl signal level f	from a transd	ucer, e.g. 0				
	– 10 Bar etc.								
P3-13	Feedback Wake Up Level	0.0	100.0	0.0	%				
	Sets a programmable level whereby if the drive enters standby mode whilst op		r PID control,	the selected	feedback				
	signal must fall below this threshold before the drive will return to normal ope	ration.							
P3-14	Standby Activation Speed	0.0	P1-01	0	Hz / Rpm				
	Determines the level at which the drive will enter into standby mode. P2-27 m	ust be set wit	h a value (tim	ne) for standb	y function				
	to be active. Drive enters standby mode if motor speed remains below the leve	el set in P3-14	for the time	period set in	P2-27.				
P3-15	2 <sup>nd</sup> PID Digital Reference Value	0.0	100.0	0.0	%				
	When P3-05 = 0, and the 2 <sup>nd</sup> digital reference is selected (see Digital Input Fun	ctions – Secti	on 10.* this p	arameter set	s the preset				
	digital reference (set-point) used for the PID Controller								
P3-16	Pump Prime Time	0	600	0	Seconds				
	A value other than zero in this parameter will automatically enable burst pipe protection function. Each time the drive is enabled								
	· · · · · · · · · · · · · · · · · · ·	whilst in PID control or is switched to PID control, the drive will monitor the PID feedback level for the time entered in P3-16. If							
	the PID feedback level does not exceed the threshold entered in P3-17 before	the time in P	3-16 expires t	hen the drive	will trip				
	with "Pr-Lo" (pressure low) trip.								
P3-17	Burst Pipe Threshold	0.0	100.0	0.0%	%				
	PID feedback threshold for the burst pump control. In direct PID mode, PID fee			•					
	threshold before the pump prime time (P3-16) expires. In inverse PID mode, P	ID feedback s	hould be large	er than or eq	ual to the				
	threshold before the pump prime time (P3-16) expires.								
P3-18	PID Reset Control	0	1	0	-				
	This parameter is used to control the reset behaviour of the PID loop.								
	0: PID loop will continue running as long as P gain (P3-0* is not zero.								
	1: PID loop will only run when drive is enabled. If drive is not running, PID out	put will reset	to 0 (Includin	ng integral res	ult)				

## 9.3. Parameter Group 4 – High Performance Motor Control

$\overline{\mathbf{V}}$	Incorrect adjustment of parameters in menu group 4 can cause unexpected behaviour of the motor and any connected machinery. It is recommended that these parameters are only adjusted by experienced users.							
Par	Parameter Name	Minimum	Maximum	Default	Units			
P4-02	Auto-tune Enable	0	1	0	-			
	When set to 1, the drive immediately carries out a non-rotating auto-tune to n	neasure the n	notor parame	ters for optin	num			
	control and efficiency. Following completion of the auto-tune, the parameter a	utomatically	returns to 0.					
P4-07	Maximum Motoring Current Limit	20.0	150.0	110.0	%-			
	This parameter defines the maximum current limit or reference used by the dr	ive.						
P4-12	Thermal Overload Value Retention	0	1	0	п			
	0 : Disabled.							
	1: Enabled. All Optidrives feature electronic thermal overload protection for the connected motor, designed to protect the motor against damage. An internal overload accumulator monitors the motor output current over time, and will trip the drive if the usage exceeds the thermal limit. When P4-12 is disabled, removing the power supply from the drive and re-applying will reset the value of the accumulator. When P4-12 is enabled, the value is retained during power off.							

## 9.4. Parameter Group 5 – Communication Parameters

P5-01	Parameter Name	Minimum	Maximum	Default	Units
	Drive Fieldbus Address	0	63	-	1
	Sets the Fieldbus address for the Optidrive				
P5-03	Modbus RTU / BACnet Baud rate	9.6	115.2	115.2	kbps
	Sets the baud rate when Modbus/BACnet communications are used				
	9.6kbps, 19.2kpbs, 38.4kpbs, 57.6kpbs, 115 kbps				
P5-04	Modbus RTU / BACnet Data Format	-	-	n= 1	-
	Sets the expected Modbus or BACnet telegram data format as follows				
	n- 1: No Parity, 1 stop bit				
	n-2: No parity, 2 stop bits				
	☐- I: Odd parity, 1 stop bit				
	E- I: Even parity, 1 stop bit				
P5-05	Communications Loss Timeout	0.0	5.0	1.0	second
	Sets the watchdog time period for the communications channel. If a valid teleg	1			
	time period, the drive will assume a loss of communications has occurred and				
P5-06	Communications Loss Action	0	3	0	_
	Controls the behaviour of the drive following a loss of communications as dete			_	(P5-06)
	0: Trip & Coast To Stop	erininea by til	c above para	meter setting	, (1 5 00).
	1: Ramp to Stop Then Trip				
	2: Ramp to Stop Only (No Trip)				
	3: Run at Preset Speed 4				
	3. Namati reset speed 4

Par	Parameter Name	Minimum	Maximum	Default	Units				
P5-13	Fieldbus Module PDI4	0	1	0	-				
	When using an optional Fieldbus interface, this parameter configures the parameter source for the 4th process data word								
	transferred from the network master to the drive during cyclic communications:								
	0: User ramp time – In second with two decimal places.								
	1: User Register 4 – Can be accessed by PLC program or group 9 parameters								
P5-14	Fieldbus Module PDI3	0	2	0	-				
	When using an optional Fieldbus interface, this parameter configures the para	meter source	for the 3rd p	rocess data w	ord/				
	transferred from the network master to the drive during cyclic communication	s:							
	0 : Not used - No function								
	1 : User PID Reference - 0 to 1000 = 0% to 100.0%								
	2: User Register 3 – Can be accessed by PLC program or group 9 parameters								

## 9.5. Parameter Group 8 – HVAC Function Specific Parameters

P8-01	Parameter Name	Minimum	Maximum	Default	Units						
	Stir Interval Duration	0	60000	0	mins						
	Period of inactivity (drive is standby mode) that will trigger the drive stir functi	ion.									
8-02	Stir Activation Time	1	6000	10	Secs						
	Set the time period that the stir function will be active once triggered (exclude	es time for de	eleration to s	stop)							
8-03	Cleaning Function Select	0	3	0	-						
	This parameter configures the drive conditions that will cause activation of the	e automatic p	ump clean fur	nction.							
	0 = Disabled										
	1 = Active on Start up Only. The pump cleaning function operates every time t	the pump is st	arted.								
	2 = Active on start up and over-torque detection. The pump cleaning function	operates eve	ery time the p	ump is starte	d, and als						
	in the event that the drive detects a possible pump blockage during normal op	eration. This	requires the L	oad Profile N	lonitoring						
	function to be active and commissioned for correct operation, see parameter	P8-06.									
	3 = Active on over-torque detection only. The pump cleaning function operate										
	during normal operation. This requires the Load Profile Monitoring function to	be active and	d commission	ed for correct	t operatio						
	see parameter P8-06.										
	Note: The pump clean function can also be activated by digital input configure										
	For further information on the pump cleaning function, refer to the Optidrive	HVAC Pump C	leaning Funct	ion Application	on Note.						
P8-04	Cleaning Time	0	600	0	Secs						
	Sets the time period for the operation of the pump cleaning cycle. When bi-dir	rectional pum	p cleaning is s	selected, the	time						
	interval is used twice, once in each direction.										
P8-05	Clean Function Ramp Time	0.0	6000	30	Secs						
	Independent ramp rate used only for the pump automatic cleaning function (s	see P8-03) wh	en the motor	is Accelerate	d as part (						
	the cleaning cycle.										
Note:	For full detail of Clean function configuration see section 7.5, Pump Clean Func	ction, or cont	act your local	Invertek distr	ributor						
P8-06	Load Monitor Enable	0	3	0	-						
	This parameter enables the Load Profile Monitoring Function (load current mo	nitoring), wh	ich can be use	d to detect b	elt failure						
	in belt driven fan applications, or Dry Pump, Pump Blockage or broken impelle	er in Pump app	olications.								
	0: Disabled										
	1: Low Load Detection Enabled (Belt Failure / Dry Pump / Broken Impeller)										
	2: High Load Detection Enabled (Pump Blockage)										
	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection										
	2: High Load Detection Enabled (Pump Blockage)	e HVAC Load F	Profile Monito	ring Function	ı						
	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.										
<b>A</b>	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically ru	un the motor	through its pr	rogrammed f	requency						
$\overline{\wedge}$	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in	un the motor	through its pr	rogrammed f	requency						
<u>^</u>	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically ru	un the motor	through its pr	rogrammed f	requency						
P8-07	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth	un the motor a suitable co	through its pr ndition to allo 50.0	rogrammed fow the motor	requency to run Amps						
P8-07	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.	un the motor a suitable co	through its pr ndition to allo 50.0	rogrammed fow the motor	requency to run Amps						
P8-07	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidtl	un the motor a suitable con 0.1 0-06 has been h set in P8-07	through its prondition to allow 50.0 set to an appropriate for a period left.	rogrammed for the motor  1.0  ropriate value onger than the	requency to run  Amps to detection						
P8-07	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8	un the motor a suitable con 0.1 0-06 has been h set in P8-07	through its prondition to allow 50.0 set to an appropriate for a period left.	rogrammed for the motor  1.0  ropriate value onger than the	requency to run  Amps to detect at define						
P8-07	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidtl	un the motor a suitable con 0.1 0-06 has been h set in P8-07	through its prondition to allow 50.0 set to an appropriate for a period left.	rogrammed for the motor  1.0  ropriate value onger than the	requency to run  Amps to detect at define						
	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the set of	un the motor a suitable con 0.1 0-06 has been h set in P8-07	through its prondition to allow 50.0 set to an appropriate for a period left.	rogrammed for the motor  1.0  ropriate value onger than the	requency to run  Amps to detection						
	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the bandwidth for the function is 2 x P8-07.  Load Monitor Trip Delay  Parameter sets a time limit for the Load profile generated by P8-06. If P8-06 has	un the motor a suitable con 0.1 3-06 has been h set in P8-07 the normal cu 0 as been set to	through its prindition to allow 50.0  set to an apprior a period library and the 60 an appropria	1.0 ropriate value onger than the trip level, here	Amps e to detect nat define nce total  Secs etect an						
	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the bandwidth for the function is 2 x P8-07.  Load Monitor Trip Delay	un the motor a suitable con 0.1 3-06 has been h set in P8-07 the normal cu 0 as been set to	through its prindition to allow 50.0  set to an apprior a period library and the 60 an appropria	1.0 ropriate value onger than the trip level, here	Amps e to detect nat define nce total  Secs etect an						
	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the bandwidth for the function is 2 x P8-07.  Load Monitor Trip Delay  Parameter sets a time limit for the Load profile generated by P8-06. If P8-06 has	un the motor a suitable con 0.1 3-06 has been h set in P8-07 the normal cu 0 as been set to	through its prindition to allow 50.0  set to an apprior a period library and the 60 an appropria	1.0 ropriate value onger than the trip level, here	Amps e to detect nat define nce total  Secs etect an						
P8-08	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the bandwidth for the function is 2 x P8-07.  Load Monitor Trip Delay  Parameter sets a time limit for the Load profile generated by P8-06. If P8-06 has over /under load condition and the drive operates outside of the bandwidth set.	un the motor a suitable con 0.1 3-06 has been h set in P8-07 the normal cu 0 as been set to	through its prindition to allow 50.0  set to an apprior a period library and the 60 an appropria	1.0 ropriate value onger than the trip level, here	Amps e to detect nat define nce total  Secs etect an						
P8-08	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the bandwidth for the function is 2 x P8-07.  Load Monitor Trip Delay  Parameter sets a time limit for the Load profile generated by P8-06. If P8-06 had over /under load condition and the drive operates outside of the bandwidth set P8-08 and then the drive will trip.	0.1 3-06 has been h set in P8-07 the normal cu 0 as been set to et in P8-07 for	through its production to allow 50.0  set to an appropriation of the following appropriation	1.0 ropriate value onger than the trip level, here to deger than that	Amps to detect to total  Secs etect an defined b						
P8-08	2: High Load Detection Enabled (Pump Blockage) 3: Low and High Current Detection For further information on the load monitoring function, refer to the Optidrive Application Note.  Adjustment of parameter P8-06 (<>0) will cause the drive to automatically rurange upon the next drive enable (input enable). Ensure the application is in safely through its frequency range prior to enabling this feature.  Load Profile Bandwidth  Parameter sets a bandwidth around the Load profile generated by P8-06. If P8 an over /under load condition and the drive operates outside of the bandwidth by P8-08 then the drive will trip. Value entered in P8-07 is the value between the bandwidth for the function is 2 x P8-07.  Load Monitor Trip Delay  Parameter sets a time limit for the Load profile generated by P8-06. If P8-06 had over /under load condition and the drive operates outside of the bandwidth set P8-08 and then the drive will trip. Par	Parameter Name	Minimum	Maximum	Default	Units				
P8-10	Fire Mode Speed	-P1-01	P1-01	0.0	Hz / Rpm				
	When set to a non-zero value, this parameter sets an operational fixed freque	ncy / speed u	sed when Fire	Mode is sele	cted. The				
	drive will maintain operation at this frequency until the fire mode signal is removed or the drive is no longer able to sustain								
	operation.								
	When P8-10 is zero, and fire mode is activated, the drive will continue to opera	ate under the	control of the	e selected spe	eed				
	reference, dependent on parameter settings and digital input selection.								
P8-11	Bypass Mode on Fault	0	1	0	-				
	Parameter configures the drive to switch to bypass mode automatically should	l a trip occur	on the drive. '	When enable	d the drive				
	standard relays 1 and 2 are dedicated to bypass control and cannot be assigne	d other funct	ions.						
	0 = Disabled								
	1 = Enabled								
P8-12	Bypass mode of Fire	0	1	0	-				
	Parameter configures the drive to switch to bypass mode automatically should	l an input to t	he drive be co	onfigured for	Fire Mode				
	operation and that input becomes active. When enabled the drive standard re	lays 1 and 2 a	re dedicated	to bypass cor	ntrol and				
	cannot be assigned other functions.								
	0 = Disabled								
	1 = Enabled								
	For further information on using the Bypass function, refer to the Optidrive HV	AC Bypass fu	nction Applic	ation Note.					
P8-13	Bypass Contactor Changeover Time	0	30	2	Secs				
	Parameter active when Bypass function is enabled. Parameter P8-05 sets a tim	e delay or ch	angeover tim	e between th	e switching				
	of the drive relays controlling the bypass circuitry.								
A	Care must be taken when setting P8-13 to ensure that drive and DOL contacto	rs are not swi	tched in circu	ıit simultaneo	usly.				
<b>/!</b> \	Both Mechanical and Electrical interlocking of drive and DOL contactors to re	gional standa	ards are reco	mmended in	configuring				
~	the Bypass function.

P0-04	Speed Controller Reference	Hz / Rpm
	Displays the set point reference input applied to the drive internal speed controller	1 ,
P0-06	Digital Speed Reference	Hz / Rpm
	Displays the value of the drive internal Motorised Pot (used for keypad) speed reference	1 .
P0-07	Fieldbus Speed Reference	Hz / Rpm
	Displays the set-point being received by the drive from the currently active Fieldbus interface.	_
P0-08	PID Reference	%
	Displays the set-point input to the PID controller.	
P0-09	PID Feedback	%
	Displays the Feedback input signal to the PID controller	
P0-10	PID Output	%
	Displays the output level of the PID controller	
P0-11	Motor Voltage	V
	Displays the instantaneous output voltage from the drive to the motor	
P0-13	Trip Log	%
	Displays the last four fault codes for the drive. Refer to section 15.1 for further information	•
P0-14	Magnetising Current (Id)	А
	Displays the motor magnetising Current, providing an auto tune has been successfully completed.	<u>'</u>
P0-16	DC Bus Voltage Ripple	Vrms
	Displays the level of ripple present on the DC Bus Voltage. This parameter is used by the Optidrive for various in	ternal protection
	and monitoring functions.	'
P0-17	Stator Resistance (Rs)	Ohms
	Displays the measured motor stator resistance, providing an auto tune has been successfully completed.	
P0-19	Cascade Run Time Log	Hrs
	Run Time values for variable speed and DOL pumps used in cascade function. 5 entry log.	
	0 = Master, 1 = DOL1, 2 = DOL2, 3 = DOL3, 4 = DOL4	
	Clocks can be reset through P8-20, Master Clock Reset.	
P0-20	DC Bus Voltage	Volts
	Displays the instantaneous DC Bus Voltage internally within the drive	
P0-21	Drive Temperature	°C
	Displays the Instantaneous Heatsink Temperature measured by the drive	
P0-22	Time Left to Next Service	Hours
	Displays the current time period remaining before the next maintenance becomes due. Maintenance interval is	
	value entered in P6-24 (Maintenance Time Interval) and the elapsed time since the maintenance interval was en	
P0-23	Time Heatsink >80° C	HH:MM:SS
. 0	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with a	neatsink
	temperature in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monit	
P0-24	Time Ambient >80° C	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the amount of time in hours and minutes that the Optidrive has operated for during its lifetime with an	amhient
	temperature in excess of 80°C. This parameter is used by the Optidrive for various internal protection and monit	
P0-25	Estimated Rotor Speed	Hz
. 0 23	Displays the estimated rotor speed of the motor.	112
P0-26	kWh Meter	kWh
. 0-20	Two entry display: First display shows user resettable meter (reset with P6-23). Second display shows none rese	
	Displays the amount of energy consumed by the drive in kWh. When the value reaches 1000, it is reset back to (

	Two entry display: First display shows user resettable meter (reset with P6-23). Second display shows none rese	ctapie valuė.
	Displays the amount of energy consumed by the drive in MWh.	
DO 22	Software Version	-
P0-28	Displays the software version of the driver form with display.	
P0-28	Displays the software version of the drive: Four entry display:  First display = IO Version, Second display = IO Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Version, Fourth display = IOSB Checksum, Third display = IOSB Checksum, T	keum
P0-28	Displays the software version of the drive: Four entry display:  First display = IO Version, Second display = IO Checksum, Third display = DSP Version, Fourth display = DSP Chec	ksum

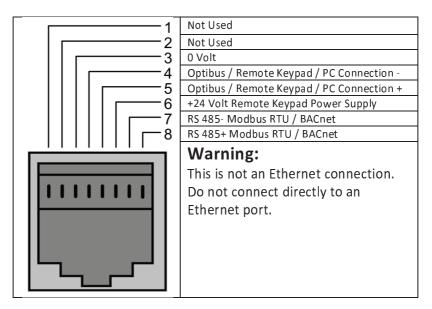

Par	Parameter Name	Units
P0-29	Drive Type	-
	Displays the type details of the drive: Three entry display:	
	First display = Frame size and input voltage level	
	Second display = Power rating	
	Third display = Output Phase Count	
P0-30	Serial Number	-
	Displays the unique serial number of the drive. Dual entry display:	
	First display = Serial number (MSB), Second display = Serial number (LMSB)	
P0-31	Run Time Since Date of Manufacturer	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive.	
P0-32	Run Time Since Last Trip 1	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive since the last fault occurred. Run-time clock stopped by drive disable to the last fault occurred.	ole (or trip), reset
	on next enable only if a trip occurred. Reset also on next enable after a drive power down.	
P0-33	Run Time Since Last Trip 2	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive since the last fault occurred. Run-time clock stopped by drive disable	
	on next enable only if a trip occurred (under-volts not considered a trip) – not reset by power down / power up	cycling unless a
	trip occurred prior to power down.	
P0-34	Run Time Since Last Disable	HH:MM:SS
	Two entry display: First display shows hours. Second display shows minutes and seconds	
	Displays the total operating time of the drive since the last Run command was received.	
P0-35	Fan Run Time	HH:MM:SS
	Displays the total operating time of the Optidrive internal cooling fans.	
	Two entry display: First display shows user resettable time (reset with P6-22). Second display shows none resett	able time.
	This is used for scheduled maintenance information	
P0-36	DC Bus Voltage Log (256ms)	-
	Diagnostic log for DC bus voltage. Values logged every 256mS with 8 samples total. Logging suspended on drive	trip.
P0-37	DC Bus Voltage Ripple Log (20ms)	-
	Diagnostic log for DC bus voltage ripple. Values logged every 20mS with 8 samples total. Logging suspended on o	rive trip.
P0-38	Heatsink Temperature Log (30s)	-
	Diagnostic log for heatsink temperature. Values logged every 30S with 8 samples total. Logging suspended on dr	ive trip.
P0-39	Ambient Temperature Log (30s)	
	Diagnostic log for drive ambient temperature. Values logged every 30S with 8 samples total. Logging suspended	on drive trip.
P0-40	Motor Current Log (256ms)	-
	Diagnostic log for Motor Current. Values logged every 256mS with 8 samples total. Logging suspended on drive	rin
Note:	The above parameters (P0-36 to P0-40) are used to store the history of various measured levels within the drive	
	time intervals prior to a trip. The values are frozen when a fault occurs and can be used for diagnostic purposes.	at various regun

## 10. Serial communications

#### 10.1. RS-485 communications

Optidrive HVAC has an RJ45 connector located within the wiring enclosure of the drive. This connector allows the user to set up a drive network via a wired connection. The connector contains two independent RS485 connections, one for Invertek's Optibus Protocol and one for Modbus RTU / BACnet.

The electrical signal arrangement of the RJ45 connector is shown as follows:

The Optibus data link is used for connection of Invertek peripherals and inter-drive communication. .

The Modbus interface allows connection to a Modbus RTU network as described below.

## 10.2. Modbus RTU Communications

### 10.2.1. Modbus Telegram Structure

The Optidrive HVAC2 supports Master / Slave Modbus RTU communications, using the 03 Read Holding Registers and 06 Write Single Holding Register commands. Many Master devices treat the first Register address as Register 0; therefore it may be necessary to convert the Register Numbers detail in section 12.2.2 by subtracting 1 to obtain the correct Register address. The telegram structure is as follows:-

Command 03 – Read Holding Registers								
Master Telegram	laster Telegram Length			Slave Response	L	ength		
Slave Address	1	Byte		Slave Address	1	Byte		
Function Code (03)	1	Byte		Function Code (03)	1	Byte		
1 <sup>st</sup> Register Address	2	Bytes		Starting Address	1	Byte		
No. Of Registers	2	Bytes		1 <sup>st</sup> Register Value	2	Bytes		
CRC Checksum	2	Bytes		2 <sup>nd</sup> Register Value	2	Bytes		
				Etc				
				CRC Checksum	2	Bytes		

Comm	and (	6 – Write	Sir	Command 06 – Write Single Holding Register											
Master Telegram Length				Slave Response	L	ength									
Slave Address	1	Byte		Slave Address	1	Byte									
Function Code (06)	1	Byte		Function Code (06)	1	Byte									
Register Address	2	Bytes		Register Address	2	Bytes									
Value	2	Bytes		Register Value	2	Bytes									
CRC Checksum	2	Bytes		CRC Checksum	2	Bytes									

#### 10.2.2. Modbus Control & Monitoring Registers

The following is a list of accessible Modbus Registers available in the Optidrive HVAC.

- When Modbus RTU is configured as the Fieldbus option, all of the listed registers can be accessed.
- Registers 1 and 2 can be used to control the drive providing that Modbus RTU is selected as the primary command source (P1-12 = 4) and no Fieldbus Option Module is installed in the drive Option Slot.
- Register 4 can be used to control the acceleration and deceleration rate of the drive providing that Fieldbus Ramp Control is enabled (P5-07 = \*
- Registers 6 to 24 can be read regardless of the setting of P1-12

Register	Upper Byte	Lower Byte	Read	Notes				
Number	)		Write					
	Command Cor	trol Word	R/W	Command control word used to control the Optidrive when operating with Modbus				
				RTU. The Control Word bit functions are as follows:-				
				Bit 0 : Run/Stop command. Set to 1 to enable the drive. Set to 0 to stop the drive.				
1				Bit 1: Fast stop request. Set to 1 to enable drive to stop with 2 <sup>nd</sup> deceleration ramp.				
				Bit 2 : Reset request. Set to 1 in order to reset any active faults or trips on the drive.				
				This bit must be reset to zero once the fault has been cleared.				
				Bit 3 : Coast stop request. Set to 1 to issue a coast stop command.				
2	Command Spe	ed Reference	R/W	Set-point must be sent to the drive in Hz to one decimal place, e.g. 500 = 50.0Hz				
3	Reserved		R/W	No Function				
	Command Ran	np times	R/W	This register specifies the drive acceleration and deceleration ramp times used when				
4				Fieldbus Ramp Control is selected (P5-08 = * irrespective of the setting of P1-12. Th				
				input data range is from 0 to 60000 (0.00s to 600.00s)				
	Error code	Drive status	R	This register contains 2 bytes.				
				The Lower Byte contains an 8 bit drive status word as follows :-				
				Bit 0 : 0 = Drive Disabled (Stopped), 1 = Drive Enabled (Running)				
				Bit 1 : 0 = Drive Healthy, 1 = Drive Tripped				
6				Bit 2 : 0 = In Auto Mode, 1 = In Hand Mode				
				Bit 3 : 0 = Drive Ready, 1 = Drive Inhibit				
				Bit 4 : Maintenance Time Not Reached, 1 = Maintenance Time Reached				
				Bit 5 : 0 = Not In Standby (Sleep), 1 = Standby (Sleep) mode active				
				The Upper Byte will contain the relevant fault number in the event of a drive trip.				
				Refer to section 15.1 for a list of fault codes and diagnostic information				
7	Output Freque	ency	R	Output frequency of the drive to one decimal place, e.g.123 = 12.3 Hz				
8	Output Curren	t	R	Output current of the drive to one decimal place, e.g.105 = 10.5 Amps				
9	Output Torque	9	R	Motor output torque level to one decimal place, e.g. 474 = 47.4 %				
10	Output Power		R	Output power of the drive to two decimal places, e.g.1100 = 11.00 kW				
11	Digital Input St		R	Represents the status of the drive inputs where Bit 0 = Digital Input 1 etc.				
20	Analog 1 Level		R	Analog Input 1 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%				
21	Analog 2 Level		R	Analog Input 2 Applied Signal level in % to one decimal place, e.g. 1000 = 100.0%				
22	Pre Ramp Spee		R	Internal drive frequency set-point				
23	DC bus voltage	es	R	Measured DC Bus Voltage in Volts				
24	Drive tempera	ture	R	Measured Heatsink Temperature in °C				

#### 10.2.3. Modbus Parameter Access

All User Adjustable parameters (Groups 1 to 5) are accessible by Modbus, except those that would directly affect the Modbus communications, e.g.

- P5-01 Drive Fieldbus Address
- P5-03 Modbus RTU Baud Rate
- P5-04 Modbus RTU Data Format

All parameter values can be read from the drive and written to, depending on the operating mode of the drive – some parameters cannot be changed whilst the drive is enabled for example.

When accessing a drive parameter via Modbus, the Register number for the parameter is the same as the parameter number, E.g. Parameter P1-01 = Modbus Register 101.

Modbus RTU supports sixteen bit integer values, hence where a decimal point is used in the drive parameter, the register value will be multiplied by a factor of ten,

E.g. Read Value of P1-01 = 500, therefore this is 50.0Hz.

For further details on communicating with Optidrive using Modbus RTU, please refer to your local Invertek Sales Partner.

## 10.3. BACnet MS/TP Communications

Refer to the seperate Optidrive HVAC BACnet User Guide for further information.

## 11. Technical Data

#### 11.1. Environmental

Ambient temperature range Operational : -10 ... 50°C (refer to section 11.5.1 on page 50 for derating information)

Storage : -40 °C ... 60 °C

Max altitude for rated operation : 1000m (refer to section 11.5.2 on page 50 for derating information)

Relative Humidity : < 95% (no condensation permitted)

### 11.2. Input Voltage Ranges

Depending upon model and power rating, the drives are designed for direct connection to the following supplies:

Model Number	Supply Voltage	Phases	Frequency
ODV-2-x2xxx-1xxxx	200 240 Valta + 100/ / 150/	1	
ODV-2-x2xxx-3xxxx	200 – 240 Volts + 10% / -15%	3	50 – 60Hz
ODV-2-x4xxx-3xxxx	380 – 480 Volts +10% / - 15%	3	

All Optidrive HVAC units have phase imbalance monitoring. A phase imbalance of > 3% will result in the drive tripping. For input supplies which have supply imbalance greater than 3% (typically the Indian sub- continent & parts of Asia Pacific including China) Invertek Drives recommends the installation of input line reactors. Alternatively, the drives can be operated as a single phase supply drive with 50% derating.

#### 11.3. Output Power and Current ratings

The following tables provide the output current rating information for the various Optidrive HVAC models. Invertek Drives always recommend that selection of the correct Optidrive is based upon the motor full load *current* at the incoming supply voltage.

200 – 24	200 – 240 Volts (+ / - 10%) 1 Phase Input, 3 Phase Output													
kW	НР	Nominal Input Current	Fus Or MC	i		Supply Nominal Motor Cable Output Cable Size Current Size		Maximum Motor Cable Length						
		Α	Non UL	UL	mm	AWG / kcmil	Α	mm	AWG / kcmil	m	feet			
			110110-	0-		AVV G / KCIIIII	, ,		AVV G / Kellilli		1000			
0.75	1	8.5	16	15	2.5	14	4.3	1.5	14	100	330			
0.75 1.5	1 2	8.5 15.2		_					,					

#### Note

- The maximum motor cable length stated applies to using a shielded motor cable. When using an unshielded cable, the maximum cable length limit may be increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length may be increased by 100%
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor. Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life
- For UL compliant installation, use Copper wire with a minimum insulation temperature rating of 70°C, UL Class CC or Class J Fuses

#### Note

- The maximum motor cable length stated applies to using a screened motor cable. When using an unscreened cable, the maximum cable length limit is increased by 50%. When using the Invertek Drives recommended output choke, the maximum cable length limited can be increased by 100%
- The PWM output switching from any inverter when used with a long motor cable length can cause an increase in the voltage at the motor terminals, depending on the motor cable length and inductance. The rise time and peak voltage can affect the service life of the motor. Invertek Drives recommend using an output choke for motor cable lengths of 50m or more to ensure good motor service life
- For UL compliant installation, use Copper wir4 with a minimum insulation temperature rating of 75°C. When using fuses type should be Class CC or Class J

## 11.4. Additional Information for UL Approved Installations

Optidrive HVAC is designed to meet the UL requirements. In order to ensure full compliance, the following must be fully observed.

Input Power Supply Re	quirements
Supply Voltage	200 – 240 RMS Volts for 230 Volt rated units, + /- 10% variation allowed. 240 Volt RMS Maximum
	380 – 480 Volts for 400 Volt rated units, + / - 10% variation allowed, Maximum 500 Volts RMS
	480 – 525 - NOT UL APPROVED
	500 – 600 Volts for 600 Volt rated units, + / - 10% variation allowed, Maximum 600 Volt RMS
Imbalance	Maximum 3% voltage variation between phase – phase voltages allowed
	All Optidrive HVAC units have phase imbalance monitoring. A phase imbalance of > 3% will result in the drive
	tripping. For input supplies which have supply imbalance greater than 3% (typically the Indian sub- continent &
	parts of Asia Pacific including China) Invertek Drives recommends the installation of input line reactors.
	Alternatively, the drives can be operated as a single phase supply drive with 50% derating.
Frequency	50 – 60Hz + / - 5% Variation
Short Circuit Capacity	All the models are suitable for use on a circuit capable of delivering not more than 100kA rms (AC) symetical
	short-circuit current with the specified maximum supply voltage.
Incoming power supply	connection must be according to section 4.3
All Optidrive HVAC unit	s are intended for indoor installation within controlled environments which meet the condition limits in section 13.1
Branch circuit protection	on must be installed according to the relevant national codes. Fuse ratings and types are shown in section 13.4
Suitable Power and mo	tor cables should be selected according to the data shown in section 13.4
Power cable connectio	ns and tightening torques are shown in section 3

Optidrive HVAC provides motor overload protection in accordance with the National Electrical Code (US).

- Where a motor thermistor is not fitted, or not utilised, Thermal Overload Memory Retention must be enabled by setting P4-12 = 1
- Where a motor thermistor is fitted and connected to the drive, connection must be carried out according to the information shown in section 4.6

## 11.5. Derating Information

Derating of the drive maximum continuous output current capacity is require when

- Operating at ambient temperature in excess of 40°C / 104°F
- Operating at Altitude in excess of 1000m/ 3281 ft
- Operation with Effective Switching Frequency higher than the minimum setting

The following derating factors should be applied when operating drives outside of these conditions

11.5.1. Derating for Ambient Temperature

Enclosure Type	Maximum Temperature Without Derating	Derate by	Maximum Permissible
IP20	50°C / 122°F	N/A	50°C
IP40	40°C / 104°F	N/A	40°C
IP55	40°C / 104°F	1.5% per °C (1.8°F)	50°C
IP66	40°C / 104°F	2.5% per °C (1.8°F)	50°C

11.5.2. Derating for Altitude

Enclosure Type	Maximum Altitude Without Derating	Derate by	Maximum Perms sable (UL Approved)	Maximum Perms sable (Non-UL Approved)
IP20	1000m / 3281ft	1% per 100m / 328 ft.	2000m / 6562 ft.	4000m / 13123 ft.
IP40	1000m / 3281ft	1% per 100m / 328 ft.	2000m / 6562 ft.	4000m / 13123 ft.
IP55	1000m / 3281ft	1% per 100m / 328 ft.	2000m / 6562 ft.	4000m / 13123 ft.
IP66	1000m / 3281ft	1% per 100m / 328 ft.	2000m / 6562 ft.	4000m / 13123 ft.

11.5.3. Derating for Switching Frequency

		Switching Frequency (Where available)									
Enclosure Type	4kHz	8kHz	12kHz	16kHz	24kHz	32kHz					
IP20	N/A	N/A	20%	30%	40%	50%					
IP40	N/A	TBC	TBC	TBC	TBC	TBC					
IP55	N/A	10%	10%	15%	25%	N/A					
IP66	N/A	10%	25%	35%	50%	50%					

11.5.4. Example of applying Derating Factors

A 4kW, IP66 drive is to be used at an altitude of 2000 metres above sea level, with 12 kHz switching frequency and 45°C ambient temperature.

From the table above, we can see that the rated current of the drive is 9.5 Amps at 40°C,

Firstly, apply the switching frequency derating, 12 kHz, 25% derating

9.5 Amps x 75% = 7.1 Amps

Now, apply the derating for higher ambient temperature, 2.5% per °C above 40 °C =  $5 \times 2.5\% = 12.5\%$ 

7.1 Amps x 87.5% = 6.2 Amps

Now apply the derating for altitude above 1000 metres, 1% per 100m above  $1000m = 10 \times 1\% = 10\%$ 

7.9 Amps  $\times$  90% = 5.5 Amps continuous current available.

If the required motor current exceeds this level, it will be necessary to either

- Reduce the switching frequency selected
- Use a higher power rated drive and repeat the calculation to ensure sufficient output current is available.

#### Troubleshooting **12.**

#### Fault messages 12.1.

Fault Code	No.	OLED Message	Description	Corrective Action
no-FLŁ	00	No Fault	No Fault	Displayed in P0-13 if no faults are recorded in the log
0-1	03	Over current trip	Instantaneous over current on drive output.	Fault Occurs on Drive Enable Check the motor and motor connection cable for phase – phase and phase – earth short circuits. Check the load mechanically for a jam, blockage or stalled condition Ensure the motor nameplate parameters are correctly entered, P1-07, P1-08, P1-09. Reduced the Boost voltage setting in P1-11 Increase the ramp up time in P1-03 If the connected motor has a holding brake, ensure the brake is correctly connected and controlled, and is releasing correctly
I.E-E-P	04	Over load trip	Drive has tripped on overload after delivering >100% of value in P1-08 for a period of time.	Check to see when the decimal points are flashing (drive in overload) and either increase acceleration rate or reduce the load.  Check motor cable length is within the limit specified for the relevant drive in section 11.3  Ensure the motor nameplate parameters are correctly entered in P1-07, P1-08, and P1-09  Check the load mechanically to ensure it is free, and that no jams, blockages or other mechanical faults exist
PS-trP	05	Hardware Over Current	Check the wiring to motor and the motor for phase to phase and phase to earth short circuits. Disconnect the motor and motor cable and retest. If the drive trips with no motor connected, it must be replaced and the system fully checked and retested before a replacement unit is installed.	
0-vort	06	Over voltage	Over voltage on DC bus	The value of the DC Bus Voltage can be displayed in P0-20 A historical log is stored at 256ms intervals prior to a trip in parameter P0-36 This fault is generally caused by excessive regenerative energy being transferred from the load back to the drive. When a high inertia or over hauling type load is connected.  If the fault occurs on stopping or during deceleration, increase the deceleration ramp time P1-04.  If operating in PID control, ensure that ramps are active by reducing P3-11
U-uort	07	Under voltage	Under voltage on DC bus	This occurs routinely when power is switched off.  If it occurs during running, check the incoming supply voltage, and all connections into the drive, fuses, contactors etc.
0-E	08	Over temperature trip	Heatsink over temperature	The heatsink temperature can be displayed in P0-21.  A historical log is stored at 30 second intervals prior to a trip in P0-38 Check the drive ambient temperature Ensure the drive internal cooling fan is operating Ensure that the required space around the drive as shown in section 3.8 thru 3.10 has been observed, and that the cooling airflow path to and from the drive is not restricted Reduce the effective switching frequency setting in parameter P2-24 Reduce the load on the motor / drive
U-E	09	Under temperature trip	Drive Under temperature	Trip occurs when ambient temperature is less than -10°C. The temperature must be raised over -10°C in order to start the drive.
P-dEF	10	Load default parameters	Factory Default parameters have been loaded	Press STOP key, the drive is now ready to be configured for the required application. Four button defaults – see section 5.8
E-tr iP	11	External trip	Digital Input External trip	E-trip requested on control input terminals. Some settings of P1-13 require a normally closed contact to provide an external means of tripping the drive in the event that an external device develops a fault. If a motor thermistor is connected check if the motor is too hot.
SC-065	12	Optibus serial comms fault	Communications Fault	Communications lost with PC or remote keypad. Check the cables and connections to external devices
FLE-dc	13	Excessive DC ripple	Excessive DC Ripple on Internal DC bus	The DC Bus Ripple Voltage level can be displayed in parameter P0-16 A historical log is stored at 20ms intervals prior to a trip in parameter P0-37 Check all three supply phases are present and within the 3% supply voltage level imbalance tolerance. Reduce the motor load If the fault persists, contact your local Invertek Drives Sales Partner
P-Lo55	14	Input phase loss Instant over current	Input phase missing trip Instantaneous over current on	Drive intended for use with a 3 phase supply, one input phase has been disconnected or lost.  Refer to fault 3 above
h 0-1			drive output.	
th-FLt	16	Thermistor Fault	Faulty thermistor on heat-sink.	Refer to your Invertek Sales Partner.

Fault Code	No.	OLED Message	Description	Corrective Action
dALA-F	17	I/O processor data	Internal memory fault.	Parameters not saved, factory defaults are reloaded.
DOC	18	error 4-20mA signal out of	4-20mA Signal Lost	If problem reoccurs, refer to your IDL Authorised Distributor.  The reference signal on Analog Input 1 or 2 (Terminals 6 or 10) has dropped
4-20F	10	range	4 ZUTTA SIGNAL LUSC	below the minimum threshold of 3mA when signal format is set to 4-20mA.
		<u> </u>		Check the signal source and wiring to the Optidrive terminals.
dA⊦A-E	19	M/C processor data error	Internal memory fault.	Parameters not saved, factory defaults are reloaded. If problem reoccurs, refer to your IDL Authorised Distributor.
U-dEF	20	User Parameter Default	User Parameter Defaults	User Parameter default has been loaded. Press the Stop key. Three button default – see section 5.9
F-Ptc	21	Motor PTC over heat	Motor PTC Over Temperature	The connected motor PTC device has caused the drive to trip (analog input 2 configured for PTC device).
FAn-F	22	Cooling Fan Fault	Cooling Fan Fault	Check and if necessary, replace the drive internal cooling fan
0-hEAL	23	Ambient Temperature	Ambient Temperature too	The measured temperature around the drive is above the operating limit.
		High	High	Ensure the drive internal cooling fan is operating Ensure that the required space around the drive as shown in sections 3.8 thru 3.10 has been observed, and that the cooling airflow path to and from the drive is not restricted Increase the cooling airflow to the drive Reduce the effective switching frequency setting in parameter P2-24 Reduce the load on the motor / drive
D-tor9	24	Exceed max torque	Over-Current Error	Current Monitoring Function has detected current levels above the normal
				operating condition for the application. Check mechanical load has not changed and that the load is not jammed or stalling. For pump application check for potential pump blockage For fan applications check airstream to and from the fan is not restricted
U-tor9	25	Output torque too low	Under-Current Error	Current Monitoring Function has detected current levels below the normal
				operating condition for the application.  Check for mechanical breakages causing loss of load (e.g. belt break).
				Check motor has not become disconnected from the drive.
OUL-F	26	Drive Output Fault	Drive output fault	Drive output fault, refer to your IDL Authorised Distributor
Sto-F	29	Internal STO circuit Error		Refer to your Invertek Sales Partner
ALF-01	40	Autotune fail 1		Measured motor stator resistance varies between phases. Ensure the motor is correctly connected and free from faults. Check the windings for correct resistance and balance.
AFE-05	41	Autotune fail 2		Measured motor stator resistance is too large. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.
ALF-03	42	Autotune fail 3	Autotune Failed	Measured motor inductance is too low. Ensure the motor is correctly connected and free from faults.
ALF-04	43	Autotune fail 4		Measured motor inductance is too large. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to
				the power rating of the connected drive.
ALF-05	44	Autotune fail 5		Measured motor parameters are not convergent. Ensure the motor is correctly connected and free from faults. Check that the power rating corresponds to the power rating of the connected drive.
Pr-Lo	48	Feedback Pressure Low	Low Pressure Detected by Pipe Fill Function	Check the pump system for leaks for burst pipes. Check the Pipe fill function has been commissioned correctly (P3-16 & P3-17)
DUL-PH	49	Output Phase Loss	Output (Motor) Phase Loss	One of the motor output phases is not connected to the drive.
5c-F0 I	50	Modbus Comms fault	Modbus communication error detected	
5c-F03	52	Option Module Fault	Fitted communication Module Fault	Internal communication to the inserted Communications Option Module has been lost. Check the module is correctly inserted
5c-F04	53	IO Card Comms fault	IO card comms trip	Internal communication to the inserted I/O Option Module has been lost. Check the module is correctly inserted
5c-F05	54	BACnet Comms fault	BACnet comms loss trip	A valid BACnet telegram has not been received within the watchdog time limit set in P5-05 Check the network master / PLC is still operating Check the connection cables Increase the value of P5-05 to a suitable level
